Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Clone version replaced gi:16944857.

During sequence assembly data is compared from overlapping clones.

Where differences are found these are annotated as variations

Where differences are found these are annotated as variations

variation annotation may not be found in the sequence submission

corresponding to the overlapping clone, as we submit sequences with

corresponding to the overlapping clone, as we submit sequences with

regions were either double-stranded or sequenced with an alternate

chemistry or covered by high quality data (i.e., phred quality >=

as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP database can be found at http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 10, constructed by the Sanger Centre Chromosome 10 Mapping Group. Further information can be found at http://www.sanger.ac.uk/HgP/Chrl0 RP11-348N5 is from the library RPCI-11.2 constructed by the group of Pieter de Jong. For further details see http://www.chori.org/bacpac/home.htm vECTOR: pBACe3.6 This sequence is the entire insert of clone RP11-348N5 The true left end of clone RP11-34921 is at 179266 in this sequence. The true right end of clone RP11-313D6 is at 44800 in this sequence.

PIGAZAR

POCCINE alpha2A-adrenergic receptor (PORAZAR) gene, con J05652.

J05652.1 GI:164303

alpha-2A-adrenergic receptor.

Porcine liver DNA.

SM Sus scrofas

Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Eut Mammalia; Eutheria; Cetartiodactyla; Suina; Suidae; Sus 1 (bases 1 to 1728)

Guyer, C.A., Horstman, D.A., Wilson, A.L., Clark, J.D., Kra and Limbird, L.E.

Unpublished (1990)

2 (bases 70 to 1582)

Guyer, C.A., Horstman, D.A., Wilson, A.L., Clark, J.D., Cra and Limbird, L.E.

Cloning, sequencing, and expression of the gene encodir porcine alpha 2-adrenergic receptor. Allosteric modulat H+, and amiloride analogs

J. Biol. Chem. 265 (28), 17307-17317 (1990)

                                                                                   * NOTE: This is a 'working draft' sequence. It currently
consists of 24 contigs. Gaps between the contigs
are represented as runs of N. The order of the pieces
is believed to be correct as given, however the sizes
tof the gaps between them are based on estimates that have
provided by the submittor.
This sequence will be replaced
the finished sequence as soon as it is available and
the accession number will be preserved.

This sequence will be preserved.

This sequence of 7387 bp in length

On Dec 5, 2001 this sequence version replaced gi:1694857.

During sequence assembly data is compared from overlapping clones.

Where differences are found these are annotated as variations
together with a note of the overlapping clone name. Note that the
variation annotation may not be found in the sequence submission

corresponding to the overlapping clone, as we submit sequences with
only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all
regions were either duuble-stranded or sequenced with an alternate
chemistry or covered by high quality data (i.e., phred quality >=
30); an attempt was made to resolve all sequencing problems, such
as compressions and repeats; all regions were covered by at least
one plasmid subclone or more than one M13 subclone; and the
assembly was confirmed by restriction digest. The following
abbreviations are used to associate primary accession numbers given
in the feature table with their source databases: Em:, EMBL; Sw:,
SWISSPROT, Tr:, TREMBL; Wp:, WORNWEPP; Information on the WORNWEPP
database can be found at
http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence
was generated from part of bacterial clone contigs of human
chromosome 10, constructed by the Sanger Centre Chromosome 10
Mapping Group. Further information can be found at
http://www.sanger.ac.uk/Projects/C_elegans/wormpep This group
of Piecer de Jong. For further details see

                                                                                                                                                                                                                   The invention relates to genotyping an alpha-2B, 2A, or 2C adrenerg receptor gene (I)-(III) by detecting a polymorphic site, comprising calpha2A or alpha2C or fragment or complement of; and an alpha-2B alpha2A or alpha2C or fragment or comprising nucleotide positions 90 of (I), a site comprising cytosine or guanine at position 753 of (I or a site comprising cytosine or guanine at position 753 of (I or a site comprising cytosine or guanine at position 753 of (I or a site comprising cytosine or guanine at position 753 of (II). The method may be used for genotyping a alpha2B, alpha2A or alpha2C receptor gene and further used to deterwher an individual is at increased risk of developing a disease colymorphic site which correlate to disease selected from cardiovast disease, central nervous system disease and compinations of these addition, the technique may be used to predict an individual's rest to an alpha2B, alpha2A, or alpha2C agonist (e.g. epinephrine, combinations of these) or antagonist (e.g. yohimbine, prazosin, ARC combinations of these) or antagonist (e.g. yohimbine, prazosin, ARC combinations of these) by detecting the polymorphic site and correlated to adenyly these, MAP kinase activity, phosphorylation or inositol phosphate levels). The present sequence is that of the human alpha-2AAR gene
                                                                                                                                                                                                                                                                                                                                                               ಥ
                                                                                                                                                                                                                                                                                                                                                                                         Se

The invention relates to genotyping an alpha-2B, 2A, or 2C adrenergic receptor gene (I)-(III) by detecting a polymorphic site, comprising;

(a) Obtaining a sample having a polymucleotide encoding an alpha-2B, alpha2A or alpha2C or fragment or comprising nucleotide positions 901-909

(b) detecting a polymorphic site comprising nucleotide positions 901-909

(c) detecting a polymorphic site comprising nucleotide positions 901-909

(d) detecting a polymorphic site comprising cytosine or guanine at positions 901-909

(e) detecting a polymorphic site comprising cytosine or guanine at positions 901-909

(f) a site comprising (A) (ggggcggggccg) or (B) (ggggcggctgag) at cypha2B, alpha2A or alpha2C receptor gene and further used to determine whether an individual is at increased risk of developing a disease associated with alpha2B, alpha2A or alpha2, comprising detecting a sesociated with alpha2B, alpha2A or alpha2, comprising detecting addition, the technique may be used to predict an individual's response contral nervous system disease selected from cardiovascular disease, central nervous system disease and combinations of these. In addition, the technique may be used to predict an individual's response combinations of these) or antagonist (e.g. vohimbine, prazosin, ARC 239, combinations of these) or antagonist (e.g. vohimbine, prazosin, ARC 239, crees) by detecting the polymorphic site and correlated to adenylyl cyclase, MAP kinase activity, phosphorylation or inositol phosphate correlated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Genotyping an alpha-2B, 2A, or 2C adrenergic receptor gene useful for determining whether an individual is at increased risk of developing a disease associated with the corresponding receptor comprises detecting a polymorphic site -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                diagnosis

This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers and the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of oligomers, the degree of methylation is calculated. The method is used: (i) for diagnosis and/or prognosis of side effects of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP's); and (ii) for differentiation of cell or tissue types and for investigating cell differentiation. The method allows the methylation status of many C residues to be determined simultaneously.

ABQ13410-ABQ54121 represent genomic DNA sequences used to illustrate the method for determining the degree of cytosine methylation described in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      the two

This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligomerotides and/or peptide-nucleic acid (PNA) oligomers and the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of oligomers, the degree of methylation is calculated. The method is used: (i) for diagnosis and/or prognosis of side effects of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP's); and (ii) for differentiation. of cell or tissue types and for investigating cell differentiation. The method allows the methylation status of many C residues to be determined simultaneously. ABQ13410-ABQ54121 represent genomic DNA sequences used to illustrate the method for determining the degree of cytosine methylation described in the disclosure of the invention.
                                                                                                                                                                                                                                                                                              useful

                                                                                                                                                                                           The present invention provides a number of human immune system associat genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, AIDS, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.

The invention relates to nucleic acids comprising a segment of chemically pretreated DNA of adrenergic alpha-1C-receptor gene. The invention also relates to oligonucleotides or peptide nucleic acid (PNA) oligomers useful for detecting cytosine methylations. The pretreated DNA is useful for the diagnosis or therapy of behavioural disorders, neurological disorders, smoking, disorders and cancer, in particular major depressive disorder, Tourette's syndrome, schizophrenia, psychiatric and neurological disorders, smoking, drug abuse, alcoholism, personality traits, compulsive gambling, human immunodeficiency virus dementia, migraine, behaviours in schizophrenic and schizoaffective patients, and suicidal behaviour in patients with schizophrenia. The nucleic acid is useful for detecting the methylation state of all CpG dinucleotides and/or single nucleotide polymorphisms (SNPs). The present sequence is human chemically treated genomic DNA.
                                                                  ៧
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                     Novel nucleic acid useful for diagnosis and therapy of behavioral disorder, neurological disorder and cancer, comprises a sequence of segment of chemically pretreated DNA of adrenergic alpha-1C-receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      .

This is the DNA sequence of a primer that was used in the PCR amplification of DNA encoding the N-terminal portion (including 22 amino acids proximal to the 5th transmembrane domain) of rat cholecystokinin CCKB receptor, a G protein coupled receptor (GPCR). The PCR product was used in the construction of an intracellular loop 3 (IC3) deleted CCKB receptor mutant. Deletion of a portion of IC3 of mammalian GPCRs is correlated with improved functional expression in yeast cells with retention of full ability to couple to the heterotrimeric G protein. The invention relates to mutant GPCRs with constitutively activating mutations that permit the detection of the receptors' functional activity in the absence of activating ligands, host cells that contain mutations that promote the functional activity of the GPCRs, host cells expressing such receptors, and vectors useful for making such cells. The host cells receptors, in high the contain mutations for the functional activity of the GPCRs.
                          Novel host cells comprising heterologous G protein-coupled receptor modified to be constitutively active, useful for high throughput screening assays for e.g. drugs, insecticides or nematacides -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New G protein-coupled receptors with a mutation in an intracell
domain, useful for high throughput screening assays for e.g. dr
insecticides or nematocides -

ö
This is the DNA sequence of a primer that was used in the PCR amplification of DNA encoding the N-terminal portion (including 39 amino acids proximal to the 5th transmembrane domain) of human alpha 2A adrenergic receptor, a G protein coupled receptor (GPCR).

The PCR product was used in the construction of an intracellular loop 3 (IC3) deleted receptor mutant. Deletion of a portion of a portion of IC3 of mammalian GPCRs is correlated with improved functional expression in yeast cells with retention of full ability to couple to the heterotrimeric G protein. The invention provides modified GPCRs having a mutation in IC3 that results in an improved functional response in cell-based assays. The modification promotes growth stimulation by a GPCR agonist, especially by improving coupling between the receptor and a heterotrimeric G protein. Polynucleotides encoding the mutated GPCR, chimeric GPCR, vectors and host cells are also claimed. The modified GPCRs can be used in improved high throughput screening assays (especially in yeast cells) for throughput screening assays (especially in yeast cells) for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                д

system antigen polypeptides treating nervous system nervous and/or t 3224 human diagnosing Nucleic acids encoding useful for preventing, cancers and metastases Nucleic acids useful for pre

SEQ ID NO 7495; 1701pp + Sequence Listing; English Disclosure;

The invention relates to novel genes (ABA11004-ABA21534) and proteins (ABB14678-ABB18001) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant) agonists are useful the diagnosis, treatment and prevention of: (a) cancer, e.g. breast on other cancers of the adrenal gland, bone, bone and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; chaemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, crohn's colitis; (c) cardiovascular disorders such as myocardial ischaemias; colitis; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases such as viral, bacterial, fungal and parasitic infections.

ACAA1 is located on chromosome 3p23-p22. (I) can be encoded by ABA93286 (or ABA93288) where the sequence comprises one of the haplotypes shown in Table 4 or one of the haplotype pairs shown in Table 3, where Tables 3 and 4 are given in the specification. The polynucleotide encoding ACAA1 can be used for providing haplotype and genotype information of an individual. Furthermore, the polynucleotide is useful for the treatment of disorders related to its abnormal expression or function. The present sequence represents the human ACAA1 gene, featuring all the single nucleotide polymorphisms (SNP) possible, from the present invention.

                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a polypeptide (I) which is a polymorphic variant (PV) of the acetyl-Coenzyme A acyltransferase (peroxisomal 3-oxoacyl-Coenzyme A thiolase) ACAA1 protein (ABB05516). ACAA1 is located on chromosome 3p23-p22. (I) can be encoded by ABA93286 (or ABA93288) where the sequence comprises one of the haplotypes shown in Table 4 or one of the haplotype pairs shown in Table 3, where Tables 3 and 4 are given in the specification. The polynucleotide encoding ACAA1 can be used for providing haplotype and genotype information of an individual. Furthermore, the polynucleotide is useful for the treatment of disorders related to its abnormal expression or function. The present sequence represents the human ACAA1 gene, where all the single nucleotide polymorphisms (SNP) possible have been given in the sequence using the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; cytosine methylation; 5'-CpG-3'; uracil; cytosine; diagnosis; drug; side effect; cancer; central nervous system; cardiovascular; gastrointestinal; respiratory system; single nucleotide polymorphism; SNP; cell differentiation; ds.

This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers and the degree of hybridisation to both classes is determined from the classes of oligomers, the degree of methylation is calculated. The method is used: (i) for diagnosis and/or prognosis of side effects of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory of the central nervous, cardiovascular, gastrointestinal and respiratory of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP's); and (ii) for differentiation. The method allows the methylation status of many C residues to be determined simultaneously.

ABQ13410-ABQ54121 represent genomic DNA sequences used to illustrate the method for determining the degree of cytosine methylation described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                              The method

methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic cytosine (C) but not methylated C, to uracil, then part of the genomic cytosine (C) but not methylated C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers and the degree of hybridisation to both classes is determined from the classes of oligomers, the degree of methylation is calculated. The method is used: (i) for diagnosis and/or prognosis of side effects of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP's); and (ii) for differentiation of cell or tissue types and for investigating cell differentiation. The method allows the methylation status of many C residues to be determined simultaneously.

ABQ13410-ABQ54121 represent genomic DNA sequences used to illustrate the method for determining the degree of cytosine methylation described in
